1 Introduction

The **ADM-VPX3-9Z5** is a high performance Defense Grade reconfigurable 3U OpenVPX format board based on the Xilinx Zynq Ultrascale+ range of Multiprocessor System-on-Chips (MPSoC).

1.1 Key Features

Key Features

- 3U Open VPX, compliant to VITA Standards 46.0 and 65
- All parts shall be Defense Grade -55 to +125 Deg C(or commercial pin compatible equivalent)
- FMC+ interface compliant to Vita 57.4 with high density connector
- Support for Zynq Ultrascale+ ZU19EG and ZU11EG MPSoC in the C1760 (42.5 x 42.5) package
- Support for Xilinx low-voltage (LVAUX) operation
- VPX P1 and P2 utilized according to OpenVPX payload slot profile SLT3-PAY-2F2U-14.2.3
- Processing System (PS) Block consisting of:
  - Quad-core ARM Cortex-A53, Dual-core ARM Cortex-R5, Mali-400 GPU
  - 1 bank of DDR4-2400 SDRAM, 1GB x72, 8GB total + ECC
  - Removable microSD Flash memory (/DEV variant only)
  - Two Quad SPI Flash memory, up to 2Gb each
- Programmable Logic (PL) block consisting of:
  - 653k logic cells (ZU11EG) or 1143k logic cells (ZU19EG)
  - 1 bank of DDR4-2400 SDRAM, 1GB x72, 8GB total + ECC
- 4-lanes of HSSIO on the PS block which connect to the control plane and the user defined area on P1.
- Voltage and temperature monitoring
- Air-cooled and conduction-cooled configurations

ADM-VPX3-9Z5/z-2(c)

Name	Symbol	Configurations
Configuration	T	/CC4/PB = XQZU19EG-1M Q Grade FPGA / Cond. Cooled MIL temp / Sn-Pb Solder /Z19-2/CC3/PB = XQZU19EG-2I Q Grade FPGA / Cond. Cooled IND temp / Sn-Pb Solder

Table 2 : Build Options

Not all combinations may be available. Please check with Alpha Data sales for details.

2 Installation

2.1 Handling Instructions

The components on this board can be damaged by electrostatic discharge (ESD). To prevent damage, observe ESD precautions:

- Always wear a wrist-strap when handling the card
- Hold the board by the edges
- Avoid touching any components
- Store in ESD safe bag.

2.2 Hardware Installation

2.2.1 System Requirements

The ADM-VPX3-9Z5 is a 3U OpenVPX compliant FPGA card with FMC front IO interface.

Alpha Data offers a Rear Transition Module (RTM) that breaks out all P2 IO and P1 control lanes (Part number: ADM-VPX3-9Z5-RTM).

2.2.2 Cooling Requirements

The power dissipation of the board is highly dependent on the FPGA application. A power estimator spreadsheet is available on request from Alpha Data. This should be used in conjunction with Xilinx power estimation tools to determine the approximate current requirements for each power rail.

The board is supplied with a passive air cooled or conduction cooled heatsink according to the order number given at time of purchase. It is the users responsibility to ensure sufficient airflow for air cooled applications and appropriate metalwork for conduction cooled applications.

The board features system monitoring that measures the board and FPGA temperature. It also includes a self-protection mechanism that will clear the target FPGA configuration if an over-temperature condition is detected.

See Section System Monitoring for health monitoring details.

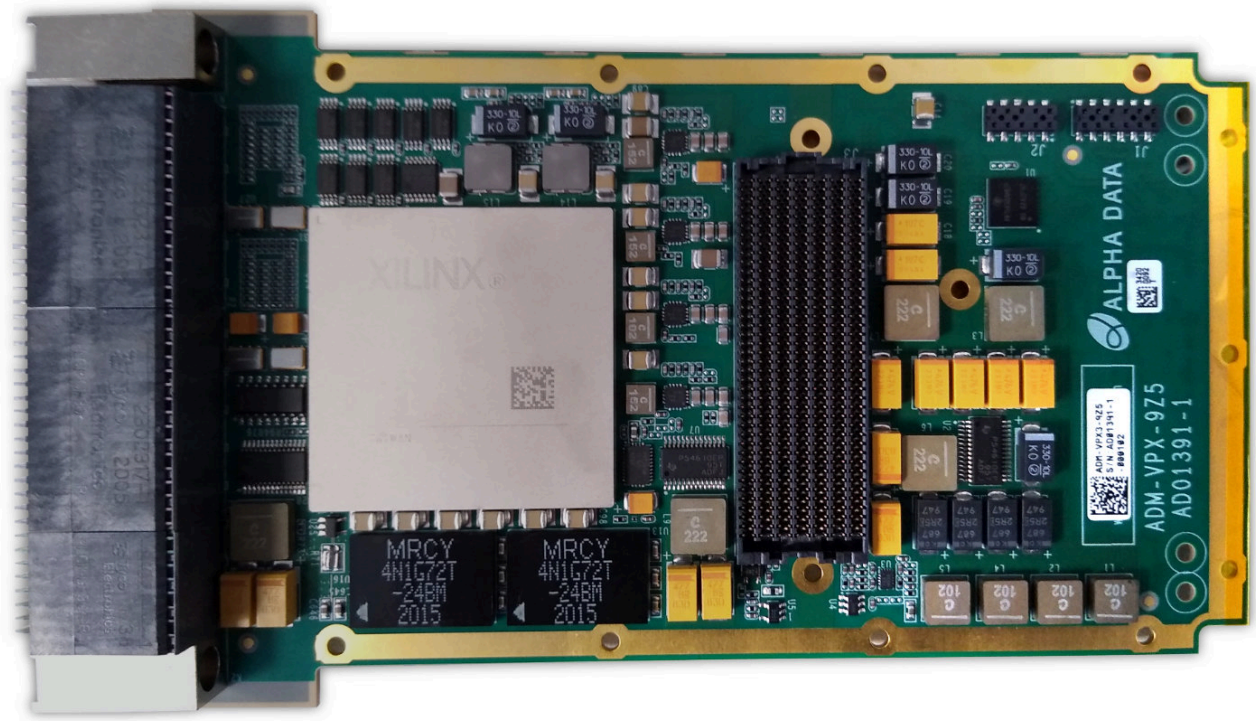

Figure 1 : ADM-VPX3-9Z5

2.3 Software Installation

Please refer to the Reference Designs on the Alpha Data Download Site. Example projects for configuring the Zynq Ultrascale+ MPSOC device and example software for running on the ARM CPUs can be downloaded from there.

3 Functional Description

3.1 Overview

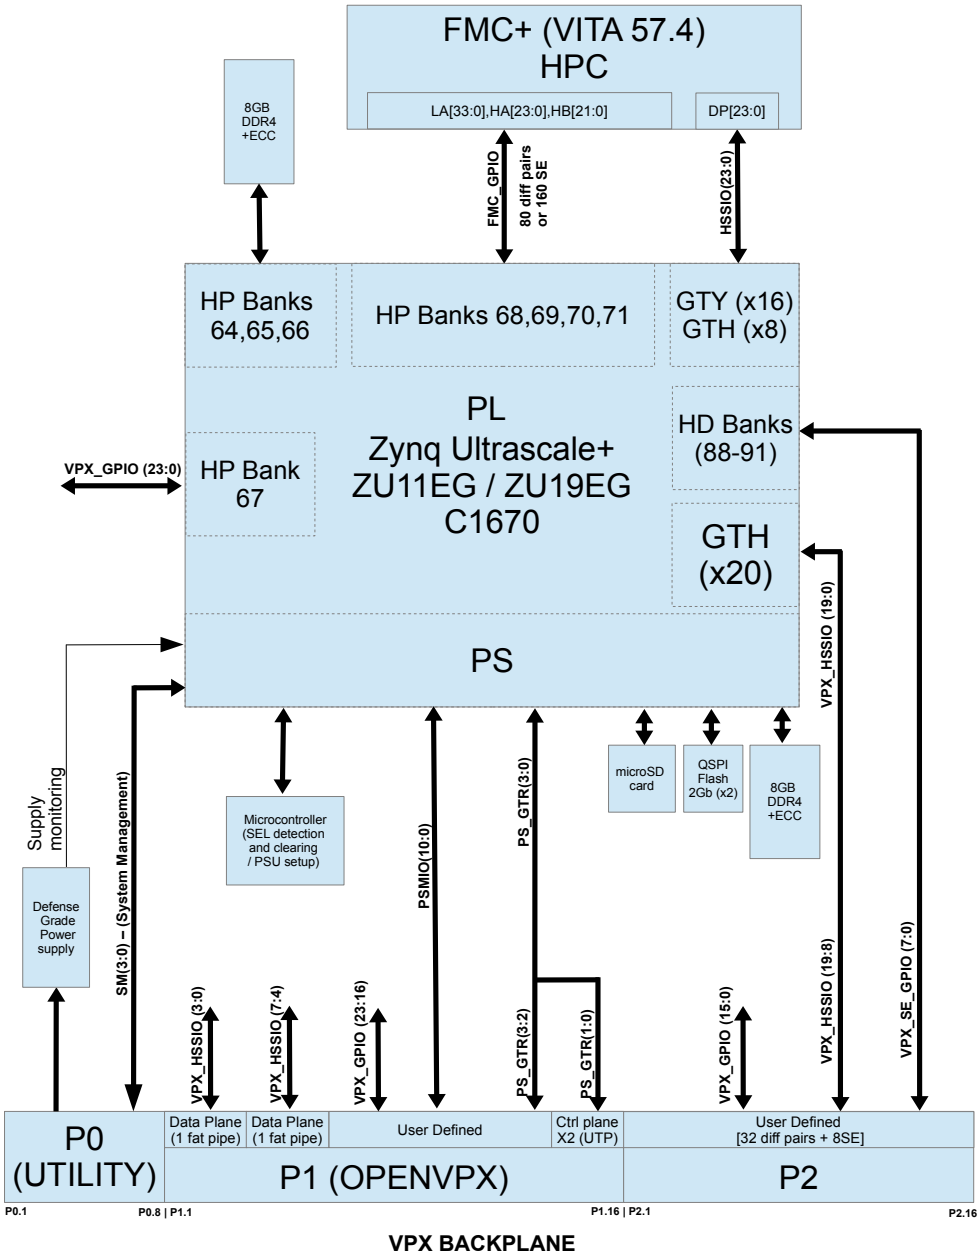

Figure 2 : ADM-VPX3-9Z5 Block Diagram

3.1.1 Switch Definitions

There are two sets of eight DIP switches placed on the bottom of the board. Their functions are described below.

> **Note:**
> All switches are OFF by default. Factory Configuration switch must be in the OFF position for normal operation.

Switch Ref.	Function	ON State	Off State
SW1-(4:1)	PS_MODE(3:0)	PS Boot Mode - see section Boot Modes	
SW1-5	Hardware Reset	Hardware Reset (complete restart)	Normal Operation
SW1-6	Software Reset	Software Reset (warm reset)	Normal Operation
SW1-7	PS_SE_EN	PS Single Ended enabled	PS Single Ended disabled
SW1-8	P2_SE_EN	P2 Single Ended enabled	P2 Single Ended disabled

Table 3 : Processor Setup Switch Definitions (SW1)

Switch Ref.	Function	ON State	Off State
SW2-1	P1_LVDS_EN	P1 low voltage GPIO Enabled	P1 low voltage GPIO Disabled
SW2-2	CLKA_SEL	CLKA = 100MHz	CLKA = 125MHz
SW2-3	CLKB_SEL	CLKB = 161.13MHz	CLKB = 156.25MHz
SW2-4	User Switch	PSMIO26=logic low	PSMIO26=logic high
SW2-5	VPX JTAG	Connect JTAG chain to P0	Isolate JTAG chain from P0
SW2-6	P2_LVDS_EN	P2 low voltage GPIO Enabled	P2 low voltage GPIO Disabled
SW2-7	Factory Configuration	-	Normal Operation
SW2-8	LVAUX_EN	LVAUX mode enabled	Normal Operation

Table 4 : VPX Control Switch Definitions (SW2)

3.1.2 LED Definitions

There are seven LEDs to provide a visual indication of the board status.

Their locations are shown in Figure 3

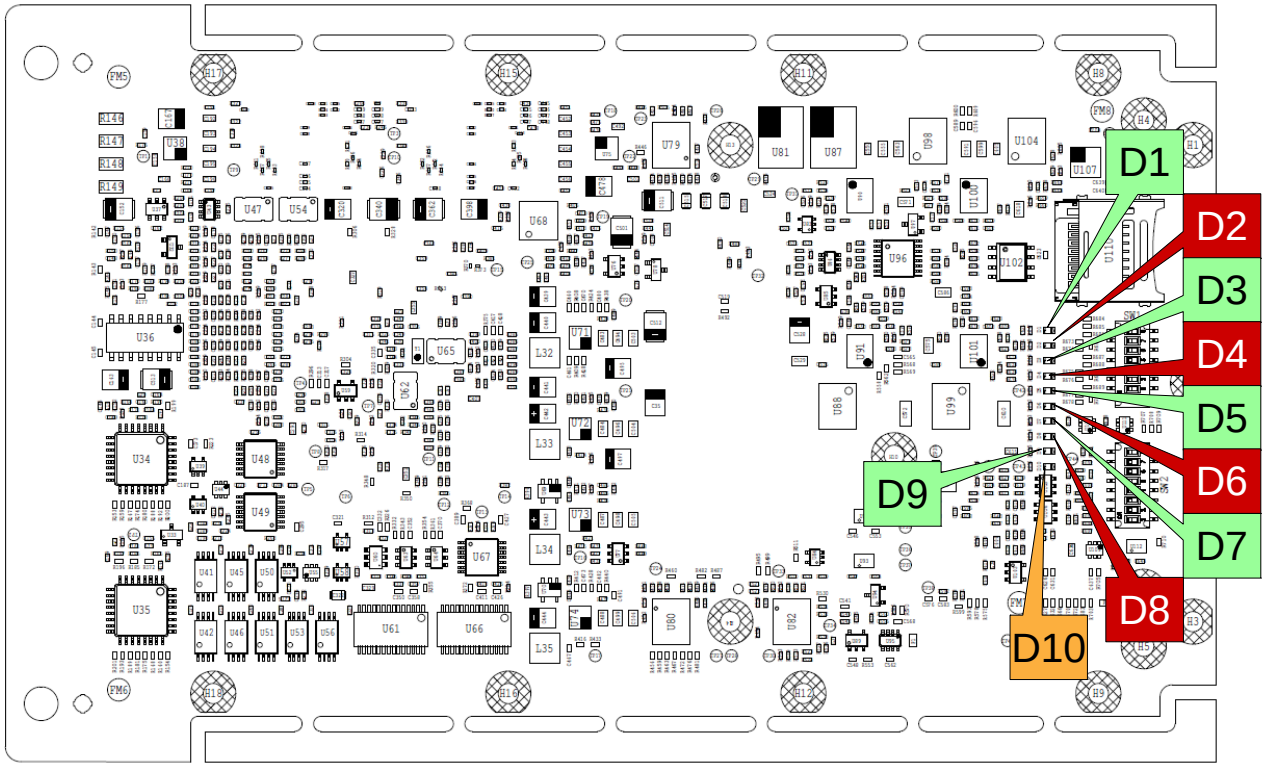

Figure 3 : LED Locations

Comp. Ref.	Function	ON State	Off State
D3 (Green)	System Monitor Status	See Table 26	
D6 (Red)	System Monitor Status	See Table 26	
D9 (Green)	FPGA (PL) Done	PL is configured	PL is not configured
D10 (Amber)	VPX JTAG STATUS	JTAG chain Connected to VPX P0	JTAG chain isolated from VPX P0
D2 (Red)	Power Fault	Power Supply Fault	Power Supplies off or within range
D8 (Red)	PS Error	PS Error	Normal Operation
D7 (Green)	PS Status	Normal Operation	PS is in Reset / Error

Table 5 : Status LED Definitions

There also are three user defined LEDs available:

Comp. Ref.	FPGA Pin	Bank	Operation
D4 (Red)	D9	PL Bank 93	Logic low = LED ON
D5 (Green)	C9	PL Bank 93	Logic low = LED ON
D1 (Green)	U28	PSMIO 46	Logic low = LED ON

Table 6 : User Defined LEDs

3.2 VPX P0 Interface

3.2.1 SYSRESET#

When the 9Z5 is NOT acting as the system controller:

- SYSRESET# is an active low input from the system controller
- SYSRESET# is connected to the FPGA PL side PERSTN0 PCIe reset pin on Bank 65 (Pin AM25)
- SYSRESET# is connected to the FPGA PS side PS_POR_B hard reset pin on Bank 503 (Pin W27)

When the 9Z5 is acting as the system controller:

- SYSRESET# is an active low output to the rest of the system
- SYSRESET# is driven from PSMIO 56 (Pin AA30)

3.2.2 AUXCLK

Auxiliary Clock. In OpenVPX this clock line can be used for 1PPS synchronization signaling and is an INPUT to the FPGA at Bank93 pin G8 (LVCMOS33) .

3.2.3 REFCLK

Reference Clock. This clock is an input to the onboard clock distribution and generation system. In OpenVPX this 50MHz clock can be used to align all system clocks.

When the 9Z5 is NOT acting as a system controller this clock is an INPUT to the FPGA at Bank93 pin F8 (LVCMOS33)

When the 9Z5 IS acting as a system controller this clock is an OUTPUT from the FPGA at Bank93 pin G7 (LVCMOS33)

3.3 VPX P1 GPIO

3.3.1 Differential / Low Voltage GPIO

In normal operating mode these differential GPIO on P1 are compatible with 1.8V signaling such as LVDS and 1.8V single ended signals.

In LVAUX operating mode the GPIO on P1 are compatible with 1.2V signaling such as LVDS_12 and 1.2V single ended signals.

These signals are routed differentially to/from FPGA Bank 67 and are enabled / disabled via switch SW2-1.

The FPGA can NOT accept signal levels above 1.8V (normal operation) or above 1.2V (LVAUX mode) on these signals, **otherwise damage to the FPGA device may occur**.

Care must be taken to ensure that the acceptable signal limits will not be exceeded prior to enabling these GPIO lines.

3.3.2 Single Ended PSMIO GPIO

The Single Ended GPIO on P1 are compatible with 3.3V single ended signals and are routed from PSMIO on Bank 501.

The FPGA is protected from inappropriate signal levels by a low resistance quick switch and can accept up to 3.3V on an input.

These signals are are enabled / disabled via switch SW1-7.

3.4 VPX P2 GPIO

3.4.1 Differential / Low Voltage GPIO

In normal operating mode the differential GPIO on P2 are compatible with 1.8V signaling such as LVDS and 1.8V single ended signals.

In LVAUX operating mode the GPIO on P2 are compatible with 1.2V signaling such as LVDS_12 and 1.2V single ended signals.

These signals are routed differentially to/from FPGA Bank 67 and are enabled / disabled via switch SW2-6.

The FPGA can NOT accept signal levels above 1.8V (normal operation) or above 1.2V (LVAUX mode) on these signals, **otherwise damage to the FPGA device may occur**.

Care must be taken to ensure that the acceptable signal limits will not be exceeded prior to enabling these GPIO lines.

3.4.2 Single Ended GPIO

The Single Ended GPIO on P2 are routed to/from FPGA bank 94 and are compatible with 3.3V single ended signals.

The FPGA is protected from inappropriate signal levels by a low resistance quick switch and can accept up to 3.3V on an input.

These signals are are enabled / disabled via switch SW1-8.

3.5 JTAG Interface

3.5.1 On-board Interface

A JTAG boundary scan chain is connected to header J1. This allows the connection of the Xilinx JTAG cable via adapter board AD-JTAG-ADPT2.

Adapter board AD-JTAG-ADPT2 should be inserted into header J1 through the rear of the board, header J1 is keyed to ensure correct orientation.

The scan chain is shown in Figure JTAG Boundary Scan Chain:

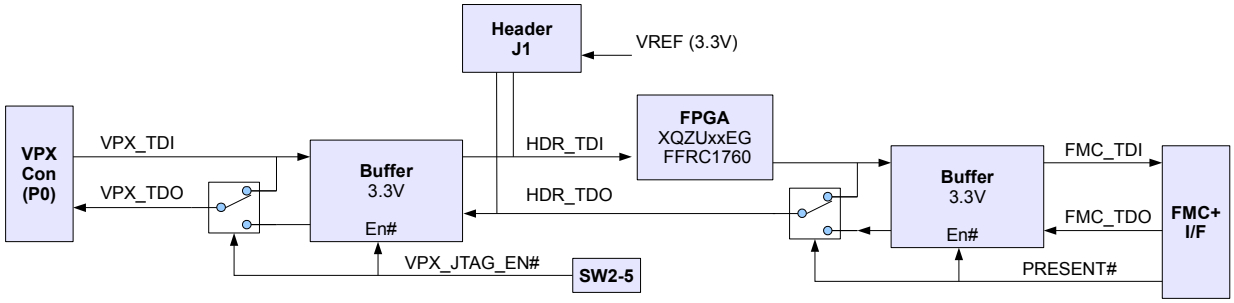

Figure 4 : JTAG Boundary Scan Chain

If the boundary scan chain is connected to the interface at the VPX backplane (SW2-5 is ON), header J1 should not be used.

3.5.2 VPX Interface

The JTAG interface on the VPX backplane is normally unused. When SW2-5 is OFF (default), all JTAG signals to P0 are left floating.

The JTAG interface can be connected to the VPX Backplane (through level-translators) by switching SW2-5 ON.

3.5.3 JTAG Voltages

The on-board JTAG scan chain uses 3.3V. The Vcc supply provided on J1 to the JTAG cable is +3.3V and is protected by a poly fuse rated at 350mA.

The JTAG signals at the VPX interface use 3.3V signal levels and are connected through buffers to the on-board scan chain.

The JTAG signals at the FMC interface also use 3.3V signal levels and are connected through buffers to FMC boards scan chain.

3.6 Clocks

The **ADM-VPX3-9Z5** board provides a wide variety of clocking options. In addition to the clocks routed from the FMC+ connector, the board has 4 selectable fixed frequency clock sources. These clocks can be combined with the FPGA's internal PLLs to suit a wide variety of communication protocols.

A complete overview of the clock routing on the **ADM-VPX3-9Z5** is given in Clocks. A description of each clock follows.

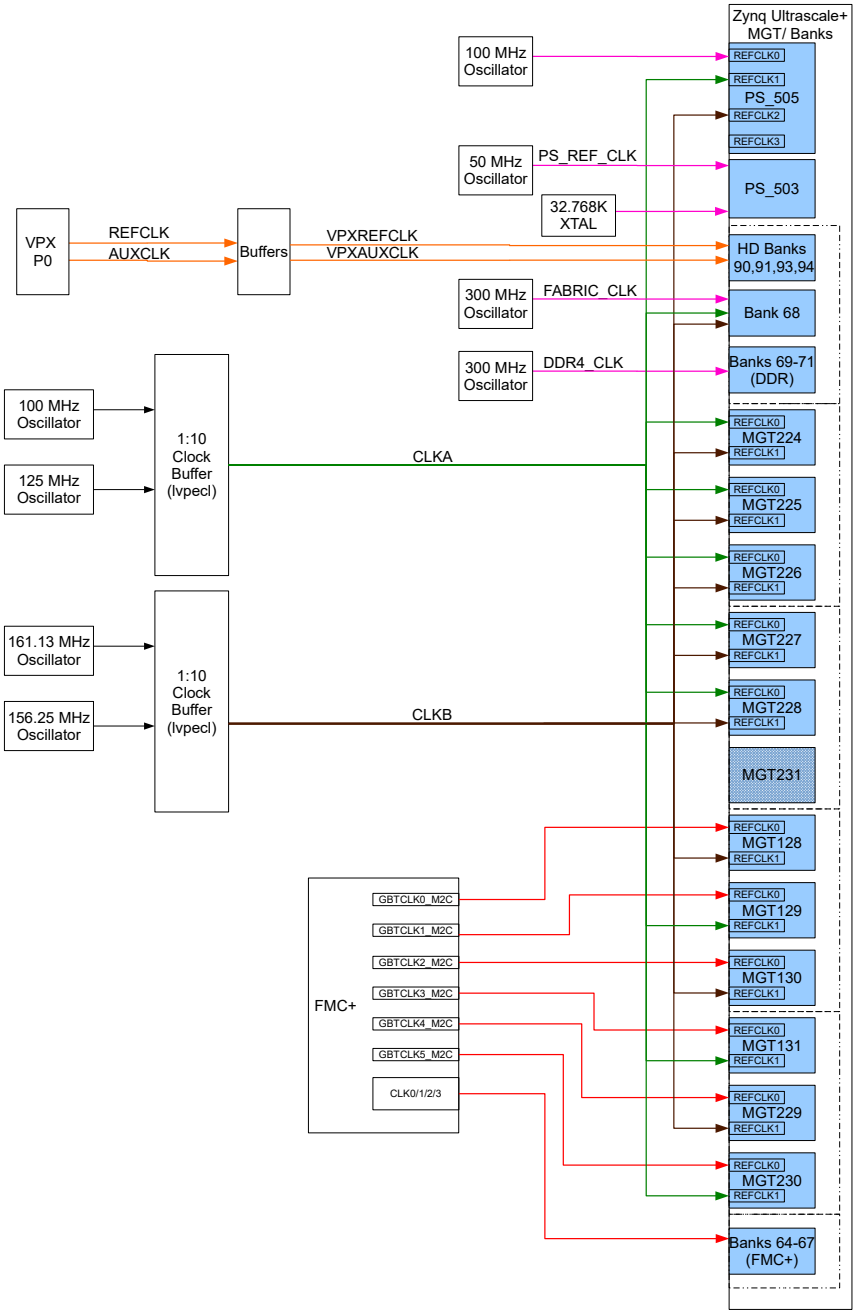

Figure 5 : Clocks

3.6.1 IO Delay Reference Clock (FABRIC_CLK)

The fixed reference clock FABRIC_CLK is a differential LVDS signal.

FABRIC_CLK is used as the reference clock for the IO delay control block (IDELAYCTRL).

Signal	Frequency	Target FPGA Input	IO Standard	"P" pin	"N" pin
FABRIC_CLK	300 MHz	IO BANK 67	LVDS	AT13	AT12

Table 7 : FABRIC_CLK Connections

3.6.2 IO Delay Reference Clock (MEM_CLK)

The fixed reference clock MEM_CLK is a differential LVDS signal.

MEM_CLK is used as the reference clock for the PL DDR memory logic.

Signal	Frequency	Target FPGA Input	IO Standard	"P" pin	"N" pin
MEM_CLK	300 MHz	IO BANK 67	LVDS	AT11	AT10

Table 8 : MEM_CLK Connections

3.6.3 Fixed 100MHz Reference clock REFCLK100M

A fixed 100MHz reference clock is available on the board.

Signal	Frequency	Target FPGA Input	IO Standard	"P" pin
REFCLK100M	100 MHz	PS_505_MGTREFCLK_0	LVDS	AG37

Table 9 : REFCLK100M Connections

3.6.4 Selectable Clocks (CLKA and CLKB)

There are two selectable clock sources that are forwarded throughout the FPGA. CLKA can be set to either 100MHz or 125MHz. CLKB can be set to either 161.13MHz or 156.25MHz.

Signal	Target FPGA Input	IO Standard	"P" pin	"N" pin
CLKA[0]	PS_505_MGTREFCLK_1	LVPECL	AE37	AE38
CLKA[1]	Bank 67	LVDS	AP10	AR10
CLKA[2]	MGTREFCLK_224	LVPECL	AK12	AK11
CLKA[3]	MGTREFCLK_225	LVPECL	AH12	AH11
CLKA[4]	MGTREFCLK_226	LVPECL	AF12	AF11
CLKA[5]	MGTREFCLK_227	LVPECL	AD12	AD11
CLKA[6]	MGTREFCLK_228	LVPECL	AB12	AB11
CLKA[7]	MGTREFCLK_129	LVPECL	U32	U33
CLKA[8]	MGTREFCLK_131	LVPECL	J32	J33
CLKA[9]	MGTREFCLK_230	LVPECL	U10	U9

Table 10 : CLKA Connections

Note: CLKA[9:0] are all buffered copies of the same clock signal.

Signal	Target FPGA Input	IO Standard	"P" pin	"N" pin
CLKB[0]	PS_505_MGTREFCLK_2	LVPECL	AC37	AC38
CLKB[1]	Bank 67	LVDS	AR13	AR12
CLKB[2]	MGTREFCLK_224	LVPECL	AJ10	AJ9
CLKB[3]	MGTREFCLK_225	LVPECL	AG10	AG9
CLKB[4]	MGTREFCLK_226	LVPECL	AE10	AE9
CLKB[5]	MGTREFCLK_227	LVPECL	AC10	AC9
CLKB[6]	MGTREFCLK_228	LVPECL	AA10	AA9
CLKB[7]	MGTREFCLK_128	LVPECL	AA32	AA33
CLKB[8]	MGTREFCLK_130	LVPECL	N32	N33
CLKB[9]	MGTREFCLK_229	LVPECL	W10	W9

Table 11 : CLKB Connections

Note: CLKB[9:0] are all buffered copies of the same clock signal.

3.6.5 Module to Carrier Global Clocks (CLK_M2C)

A connected FMC+ board can generate a number of differential Global clocks (as per the FMC standard). They each connect to an global clock input on the FPGA.

Signal	Frequency	FPGA Input	IO Standard	"P" pin	"N" pin
CLK_M2C_0	Variable	Bank 71	LVDS	F23	F22
CLK_M2C_1	Variable	Bank 71	LVDS	G22	G21
CLK_M2C_2	Variable	Bank 70	LVDS	H25	H26
CLK_M2C_3	Variable	Bank 70	LVDS	H24	G25

Table 12 : CLK_M2C Connections

3.6.6 Module to Carrier MGTREF Clocks (GBTCLK_M2C)

A connected FMC board can generate a number of differential MGT Reference clocks (as per the FMC standard) . They each connect to an MGTREFCLK input on the FPGA.

Signal	Frequency	FPGA Input	IO Standard	"P" pin	"N" pin
GBTCLK_0_M2C	Variable	MGTREFCLK_128	LVDS	AB34	AB35
GBTCLK_1_M2C	Variable	MGTREFCLK_129	LVDS	W32	W33
GBTCLK_2_M2C	Variable	MGTREFCLK_130	LVDS	R32	R33
GBTCLK_3_M2C	Variable	MGTREFCLK_131	LVDS	L32	L33
GBTCLK_4_M2C	Variable	MGTREFCLK_229	LVDS	Y12	Y11
GBTCLK_5_M2C	Variable	MGTREFCLK_230	LVDS	V12	V11

Table 13 : GCLK_M2C Connections

3.6.7 PS_REFCLK

The PS reference clock is an independent 50.0MHz reference clock. This is the master clock of the PS side of the MPSoC.

Signal	Frequency	FPGA Input	IO Standard	pin
PS_REFCLK	50MHz	PS_REF_CLK (Bank 503)	LVCMOS33	AC27

Table 14 : PS_REFCLK Connection

3.7 Resets

The Zynq PS can be reset via two switches, SW1-5 and SW1-6.

Switch	Reset Type	Effect
SW1-5	Power on Reset (PS_POR_B pin)	Clears all logic. Mode pins sampled (i.e. reconfigures hardware). Reboots MPSoC.
SW1-6	Soft Reset (PS_SRST_B pin)	Same as Power on Reset - but does not sample Mode pins (hardware configuration unchanged).

Table 15 : Reset Switches

3.8 Zynq PS Block

3.8.1 Boot Modes

PS_MODE3 (SW1-4)	PS_MODE2 (SW1-3)	PS_MODE1 (SW1-2)	PS_MODE0 (SW1-1)	Boot Mode
ON	ON	ON	ON	JTAG
ON	ON	ON	OFF	Quad SPI (24 bit addressing)
ON	ON	OFF	ON	Quad SPI (32 bit addressing)
ON	ON	OFF	OFF	SD Flash - SD 2.0

Table 16 : Boot Mode Selection

Note: all other possible switch settings are reserved / invalid.

3.8.2 PS Memory Interfaces

The memory devices attached to the PS side of the MPSoC are outlined below.

3.8.2.1 Quad SPI Flash Memory

The ADM-VPX3-9Z5 has two Quad SPI Flash devices, up to 512Mb each. They can be interfaced seperately in x1,x2,x4 modes or together in x8 mode.

3.8.2.2 MicroSD Card

The ADM-VPX3-9Z5 can interface to a MicroSD card (SD 2.0 standard at 3.3V).

The uSD card should be fitted in socket U110.

3.8.2.3 PS DDR4 Memory

The PS side of the MPSoC is connected to 1 bank of DDR4-2400 SDRAM, 1GB x72, 8GB total + ECC

3.8.3 PS MIO

11 PS MIO pins are available on VPX connector P1, which can be used to connect internal PS peripherals through to an RTM module.

Group	FPGA Bank	Name	Function
GPIO_3	PS501	PSMIO(10:0)	11 single-ended

Table 17 : VPX PS MIO Groups

3.8.4 PS MGT Links

There are a total of 4 Multi-Gigabit Transceiver (MGT) links connected to the PS side of the FPGA:

Links	Banks	Width	Max Rate	Connection
PS_GTR (1:0)	505	2	6Gbps	GTR links to VPX P1 Connector Ctrl planes (2 ultra thin pipes)
PS_GTR (3:2)	505	2	6Gbps	GTR links to VPX P1 Connector user defined area

Table 18 : PS MGT Links

3.9 Zynq PL Block

3.9.1 I/O Bank Voltages

The FPGA IO is arranged in banks, each with their own supply pins. The bank numbers, their voltage and function are shown in PL FPGA IO Banks.

IO Banks	Voltage	Purpose
68, 70, 71	FMC_VADJ	FMC+ GPIO - LA and HA
69	FMC_VIO_B	FMC+ GPIO - HB
48	1.8V or 1.2V	VPX P2 Differential GPIO
64, 65, 66	1.2V	PL DDR4 Banks
94	3.3V	VPX P2 Single Ended GPIO
93	3.3V	Setup and Control
90, 91	3.3V	Unused

Table 19 : PL FPGA IO Banks

3.9.2 PL MGT Links

There are a total of 48 Multi-Gigabit Transceiver (MGT) links connected to the FPGA, 4 of which are unused. These are connected as follows:

Links	Banks	Width	Max Rate	Connection
HSSIO(15:0)	128, 129, 130, 131	16	28Gbps	GTY links to FMC+ Socket (J3)
HSSIO(23:16)	229, 230	8	16Gbps	GTH links to FMC+ Socket (J3)
VPX_HSSIO(7:0)	224, 225	8	16Gbps	VPX P1 Connector Data Planes (2 fat pipes)
VPX_HSSIO(19:8)	224, 225	12	16Gbps	VPX P2 Connector User Defined Area
UNUSED(3:0)	231	4	-	unused - not routed out

Table 20 : PL MGT Links

3.9.3 FMC+ GPIO Interface

The FMC+ Connector (J3) has GPIO connections arranged as follows:

Group	FPGA Bank	Name	Function
LA_0	71	LA(16:2)	14 diff. Pairs / 28 single-ended
		LA_CC (1:0)	2x Regional Clocks / GPIO pairs / 4 single-ended
LA_1	70	LA(33:19)	15 diff. Pairs / 30 single-ended
		LA_CC (18:17)	2x Regional Clocks / GPIO pairs / 4 single-ended
HA_0	68	HA(16:2)	15 diff. Pairs / 30 single-ended
		HA_CC (1:0)	2x Regional Clocks / GPIO pairs / 4 single-ended
		HA(23:18)	6 diff. Pairs / 12 single-ended
		HA_CC (17)	Regional Clock / GPIO pair / 2 single-ended
HB_0	69	HB(5:1)	5 diff. Pairs / 10 single-ended
		HB(16:7)	10 diff. Pairs / 20 single-ended
		HB(21:18)	4 diff. Pairs / 8 single-ended
		HB_CC (0)	Regional Clock / GPIO pair / 2 single-ended
		HB_CC (6)	Regional Clock / GPIO pair / 2 single-ended
		HB_CC (17)	Regional Clock / GPIO pair / 2 single-ended

Table 21 : FMC+ Groups (J1)

3.9.4 VPX P1 GPIO Interface

The P1 VPX Connector has GPIO connections arranged as follows:

Group	FPGA Bank	Name	Function
GPIO_1	67	VPX_GPIO(23:16)	4 diff. Pairs / 8 single-ended

Table 22 : VPX P1 GPIO Groups

3.9.5 VPX P2 GPIO Interface

The P2 VPX Connector has GPIO connections arranged as follows:

Group	FPGA Bank	Name	Function
GPIO_0	67	VPX_GPIO(15:0)	8 diff. Pairs / 16 single-ended
GPIO_2	94	VPX_SE_GPIO(7:0)	8 single-ended

Table 23 : VPX P2 GPIO Groups

3.9.6 PL DDR4 Memory

The PL side of the MPSoC is connected to 1 bank of DDR4-2400 SDRAM, 1GB x72, 8GB total + ECC

3.10 System Monitoring

The **9Z5** has the ability to monitor temperature and voltage to maintain a check on the operation of the board. The monitoring is implemented using a TI MSP430 microcontroller (uC).

The microcontroller continually measures all voltage rails and temperature sensors and transmits the results to the FPGA, where they can be stored in blockram.

The following voltage rails and temperatures are monitored by the microcontroller:

Monitor	*Purpose*
12V0	12V Board Input Supply Voltage
5V0	5V Board Input Supply Voltage
3V3	Board Input Supply Voltage
FMC_VADJ	Variable FMC IO Supply Voltage
0V85	FPGA Core Voltage
1V8_DIG	FPGA PL side IO Supply Voltage
1V8_PSAUX	FPGA PS Aux Supply Voltage
PS_AUXIO	FPGA PS Aux IO Supply Voltage
1V8_PSAUX	FPGA PS Aux Supply Current
PS_AUXIO	FPGA PS Aux IO Supply Current
1V8_DIG	FPGA PL side IO Supply Current
12V0	12V Board Input Supply Current
Temp(1)	microcontroller internal temperature
Temp(4..2)	TMP422-EP internal temperatures (3 devices)
Temp(5)	FPGA on-die temperature (measured by TMP422-EP)
Temp(10..6)	pcb temperatures (5 different points - measured by TMP422-EP devices)

Table 24 : Voltage and Temperature Monitors (in microcontroller)

3.10.1 Automatic Temperature Monitoring

The system monitor checks that the board and FPGA are being operated within the specified limits. If the temperature is close to the limit, a "Warning Alarm" interrupt is set.

If a limit is exceeded, a "Critical Alarm" interrupt is set. After the Critical Alarm is set, there is a 5 second delay before the system monitor unconfigures the FPGA by asserting its "PROG" pin.

The purpose of this mechanism is to protect the card from damage due to over-temperature. It is possible that it will cause the user application and, possibly, the host computer to "hang".

The temperature limits are shown in Table Temperature Limits. Note that the Min and Max values include a 5°C margin to prevent measurement errors triggering a false alarm.

	Target FPGA				Board (uC and PCB)			
	Min	Lower Warning	Upper Warning	Max	Min	Lower Warning	Upper Warning	Max
Extended	-5°C	+5°C	+95°C	+105°C	-5°C	+5°C	+80°C	+90°C
Industrial	-45°C	-35°C	+95°C	+105°C	-45°C	-35°C	+80°C	+90°C
Military	-60°C	-50°C	+140°C	+170°C	-60°C	-50°C	+125°C	+135°C

Table 25 : Temperature Limits

3.10.2 System Monitor Status LEDs

LEDs D3 (Green) and D6 (Red) indicate the microcontroller status.

LEDs	*Status*
Flashing Green + Flashing Red (alternate)	Service Mode
Red	Missing application firmware or invalid firmware
Red + Green	Standby (Powered off)
Green	Running and no alarms
Flashing Green + Red	Attention - alarm active
Flashing Green + Flashing Red (together)	Attention - critical alarm active
Flashing Red	FPGA configuration cleared to protect board

Table 26 : System Monitor Status LEDs

3.11 FMC Interface and Front-Panel I/O

The FMC+ interface provides a high-performance and flexible front-panel interface through a range of interchangeable, industry standard IO modules which connect at receptacle J3.

The FMC+ interface adheres to VITA 57.4. The ADM-VPX3-9Z5 utilizes all possible FMC+ connectivity. This includes all GPIO, all MGT links, and all clock capable IO.

FMC I2C signal (SCL and SDA at C30 and C31) are connected to the system monitor microcontroller. They are used to determine operating voltage during startup and are not accesable to the user.

The FMC Present signal (PRSNT_M2C_L at connector pin H2) is connected to the system monitor microcontroller.

Note:
The ADM-VPX3-9Z5 supports only 1.8V and lower VADJ Voltages.

Page Intentionally left blank
