EMI

This equipment generates, uses, and can radiate electromagnetic energy. It may cause or be susceptible to electromagnetic interference if not installed and used with adequate EMI protection for specific applications.

Table of Contents

Table of Tables

Table of Figures

1.   Introduction

The ADM-XRC-5T2-ADV is a high performance PCI Mezzanine Card (PMC) designed for supporting development of applications using the Virtex-5 FF1738 Family of FPGA Devices.

- Virtex5 LXT: LX110T, LX155T, LX220T or LX330T

- Virtex 5 SXT: SX240T

- Virtex 5 FXT: FX100T, FX130T, or FX200T

The card uses an FPGA PCI bridge developed by Alpha-Data supporting PCI-X and PCI. A high-speed multiplexed address/data bus connects the bridge to the target (user) FPGA.

The card can also be fitted with a Primary XMC connector to provide high-speed serial links to the user FPGA.

The board is an application specific version of the ADM-XRC-5T2 and features JPEG2000 video compression capabilities and multi-gigabit serial links using 2 FCN x4 Fibre Channel connectors.

1.1.   Specifications

The ADM-XRC-5T2-ADV supports high performance PCI-X / PCI operation without the need to integrate proprietary cores into the FPGA.

- Physically conformant to VITA 42 XMC Standard

- Physically conformant to IEEE P1386-2001 Common Mezzanine Card standard (with XMC connector removed)

- 8-lane PCIe / Serial RapidIO connections to User FPGA (via XMC connector)

- 8 additional MGT links to User FPGA. (via front-panel) A cost-effective solution to applications requiring high-speed data communications such as Infiniband TA, 10G Ethernet, 4x Fibre Channel and others.

- High performance PCI and DMA controllers

- Local bus speeds of up to 80 MHz

- Up to four independent banks of 64Mx32 DDRII SDRAM (1GB total)

- Two banks of 2Mx18 DDRII SSRAM (8MB total)

- User clock programmable between 31.25MHz and 625MHz

- Stable low-jitter 200MHz clock for precision IO delays

- User front panel gigabit serial I/O – 8 lanes in 2 FCN connectors

- 4 JPEG2000 codecs (Analog Devices ADV212) which can be operated individually or in 2 tandem banks to provide compression /decompression of video data

- User rear panel PMC connector with 32 free IO signals

- Programmable I/O voltage rear interfaces

- Supports 3.3V PCI or PCI-X at 64 bits

2. Hardware Installation

This chapter explains how to install the ADM-XRC-5T2-ADV onto a PMC motherboard.

2.1. Motherboard requirements

The ADM-XRC-5T2-ADV is a 3.3V only PCI device and is not compatible with systems that use 5V PCI signalling levels.

The board must be installed in a PMC motherboard that supplies +5.0V and +3.3V power to the PMC connectors. Ensure that the motherboard satisfies this requirement before powering it up.

2.2. Handling instructions

Observe SSD precautions when handling the cards to prevent damage to components by electrostatic discharge.

Avoid flexing the board.

2.3. Installing the ADM-XRC-5T2-ADV onto a PMC motherboard

Note: This operation should not be performed while the PMC motherboard is powered up.

The ADM-XRC-5T2-ADV must be secured to the PMC motherboard using M2.5 screws in the four holes provided. The PMC bezel through which the I/O connector protrudes should be flush with the front panel of the PMC motherboard.

2.4. Installing the ADM-XRC-5T2-ADV if fitted to an ADC-PMC

The ADM-XRC-5T2-ADV can be supplied for use in standard PC systems fitted to an ADC-PMC carrier board. The ADC-PMC can support up to two PMC cards whilst maintaining host PC PCI compatibility. If you are using a ADC-PMC refer to the supplied documentation for information on jumper settings. All that is required for installation is a PCI slot that has enough space to accommodate the full-length card. The ADC-PMC is compatible with 5V and 3V PCI (32 and 64 bit) and PCI-X slots.

It should be noted that the ADC-PMC uses a standard bridge to provide a secondary PCI bus for the ADM-XRC-5T2 and that some older BIOS code does not set up these devices correctly. Please ensure you have the latest version of BIOS appropriate for your machine.

2.5. Installing the ADM-XRC-5T2-ADV if fitted to an ADC-EMC

The ADM-XRC-5T2-ADV can be supplied for use in standard PC systems fitted to an ADC-EMC carrier board. The ADC-EMC can support up to two PMC cards whilst maintaining host PCI-Express compatibility. If you are using a ADC-EMC refer to the supplied documentation for information on jumper settings. All that is required for installation is a PCIe slot that has enough space to accommodate the full-length card

3. Software Installation

Please refer to the SDK installation CD. The SDK contains drivers, examples for host control and FPGA design and comprehensive help on application interfacing.

4.   Board Description

The ADM-XRC-5T2-ADV follows the architecture of the ADM-XRC series and decouples the "target" FPGA from the PCI interface, allowing user applications to be designed with minimum effort and without the complexity of PCI design.

A separate Bridge / Control FPGA interfaces to the PCI bus and provides a simple Local Bus interface to the target FPGA. It also performs all of the board control functions including the configuration of the target FPGA, programmable clock setup and the monitoring of on-board voltage and temperature.

DDR2 SDRAM, SSRAM and serial flash memory connect to the target FPGA and are supported by Xilinx or third party IP.

IO functionality is provided using multi-gigabit I/O connectors and Pn4 signals.
Figure 1 ADM-XRC-5T2-ADV Block Diagram

4.1. Local Bus

The ADM-XRC-5T2-ADV implements a multi-master local bus between the bridge and the target FPGA using a 32- or 64-bit multiplexed address and data path. The bridge design is asynchronous and allows the local bus to be run faster or slower than the PCI bus clock to suit the requirements of the user design.
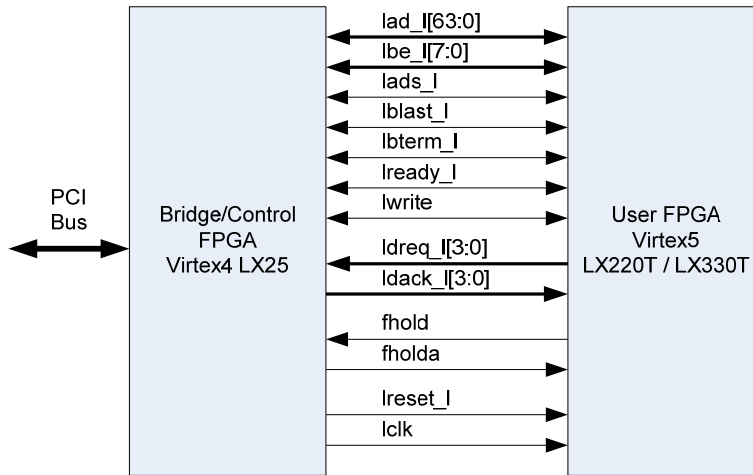

Figure 2 Local Bus Interface

Signal	Type	Purpose
lad[63:0]	bidir	Address and data bus.
lbe_l[7:0]	bidir	Byte qualifiers
lads_l	bidir	Indicates address phase
lblast_l	bidir	Indicates last word
lbterm_l	bidir	Indicates ready and requests new address phase
lready_l	bidir	Indicates that target accepts or presents new data
lwrite	bidir	Indicates a write transfer from master
ldreq_l[3:0]	unidir	DMA request from target to bridge
ldack_l[3:0]	unidir	DMA acknowledge from bridge to target
fhold	unidir	Target bus request
fholda	unidir	Bridge bus acknowledge
lreset_l	unidir	Reset to target
lclk	unidir	Clock to synchronise bridge and target

Table 1 Local Bus Interface Signal List

4.2. Flash Memory

The ADM-XRC-5T2-ADV is fitted with two separate Flash memories: one connected to the Bridge / Control FPGA and the other to the User FPGA.

4.2.1. Board Control Flash

An Intel PC28F256P30 flash memory is used for storing a configuration bitstream for the User FPGA. Once the Bridge / Control FPGA is configured, it checks for a valid bitstream in flash and if present, automatically loads it into the User FPGA. This process can be inhibited by setting a jumper on the JTAG connector. See the description of the "FBS" signal in Section 4.4 for further information.

Access to this flash device is only possible through control logic registers. The flash is not directly mapped onto the local bus.

Programming, erasing and verification of the flash are supported by the ADM-XRC SDK and driver. Utilities are provided to load bitstreams into the flash. These also verify the bitstream is compatible with the target FPGA.

4.2.2. User FPGA Flash

An ST M25P32 flash memory with SPI interface is connected to the User FPGA for the storage of application-specific information.

4.3. Health Monitoring

The ADM-XRC-5T2-ADV has the ability to monitor temperature and voltage of key parts of the board to maintain a check on the operation of the board. The monitoring is implemented by a National Semiconductor LM87 and is supported by the board control logic connected using I^2C.

The Control Logic scans the LM87 when instructed by host software and stores the current voltage and temperature measurements in a blockram. This allows the values to be read without the need to communicate directly with the monitor.

The following supplies and temperatures, as shown in Table 2, are monitored.

Monitor	Purpose
1.0V	User FPGA Core Supply
1.2V	Bridge FPGA Core Supply
1.5V	SRAM and ADV212 Core Supply
1.8V	Memories, User FPGA Memory I/O, Local Bus I/O Config CPLD Core Supply
2.5V	Source voltage for Front, Rear I/O
3.3V	Board Input Supply
5.0V	Board Input Supply
Pn4_VCCIO	Either 2.5V or 3.3V Rear (Pn4) I/O Voltage
Temp1	User FPGA die temperature
Temp2	LM87 on die temperature for board/ambient

Table 2 Voltage and Temperature Monitors

The 'sysmon' application is provided upon request that permits the reading of the health monitor. The typical output of the monitor is shown below, provided by the SYSMON program.

```
*** SysMon ***

FPGA    Space Base Adr = 00900000
Control Space Base Adr = 00d00000

+1V0 Reading = 1.01 V
+1V2 Reading = 1.21 V
+1V8 Reading = 1.81 V
+2V5 Reading = 2.51 V
+3V3 Reading = 3.32 V
+5V  Reading = 5.04 V
Pn4  Reading = 3.31 V
+1V5 Reading = 1.51 V

SysMon Int Temp =   33 deg. C
User FPGA Temp  =   26 deg. C
```

4.4.   JTAG

A JTAG header is provided to allow download of the FPGA using the Xilinx tools and serial download cables. This also allows the use of ChipScope PRO ILA to debug an FPGA design. It should be noted that four devices will be detected when the SCAN chain is initialised.
Figure 3 JTAG Header

The VCC supply provided on J5 to the JTAG cable is +3.3V and is protected by a poly fuse with a rating of 350mA.

<u>FBS</u>

The FBS signal is an input to the control logic and provides control of the cold boot process. By default with no link fitted, the control logic will load a bitstream from flash into the FPGA if one is present. Shorting FBS to the adjacent GND pin will disable this process and can be used to recover situations where rogue bitstreams have been stored in flash.

4.5.   Clocks

The ADM-XRC-5T2-ADV is provided with numerous clock sources, as shown in Figure 4 below:
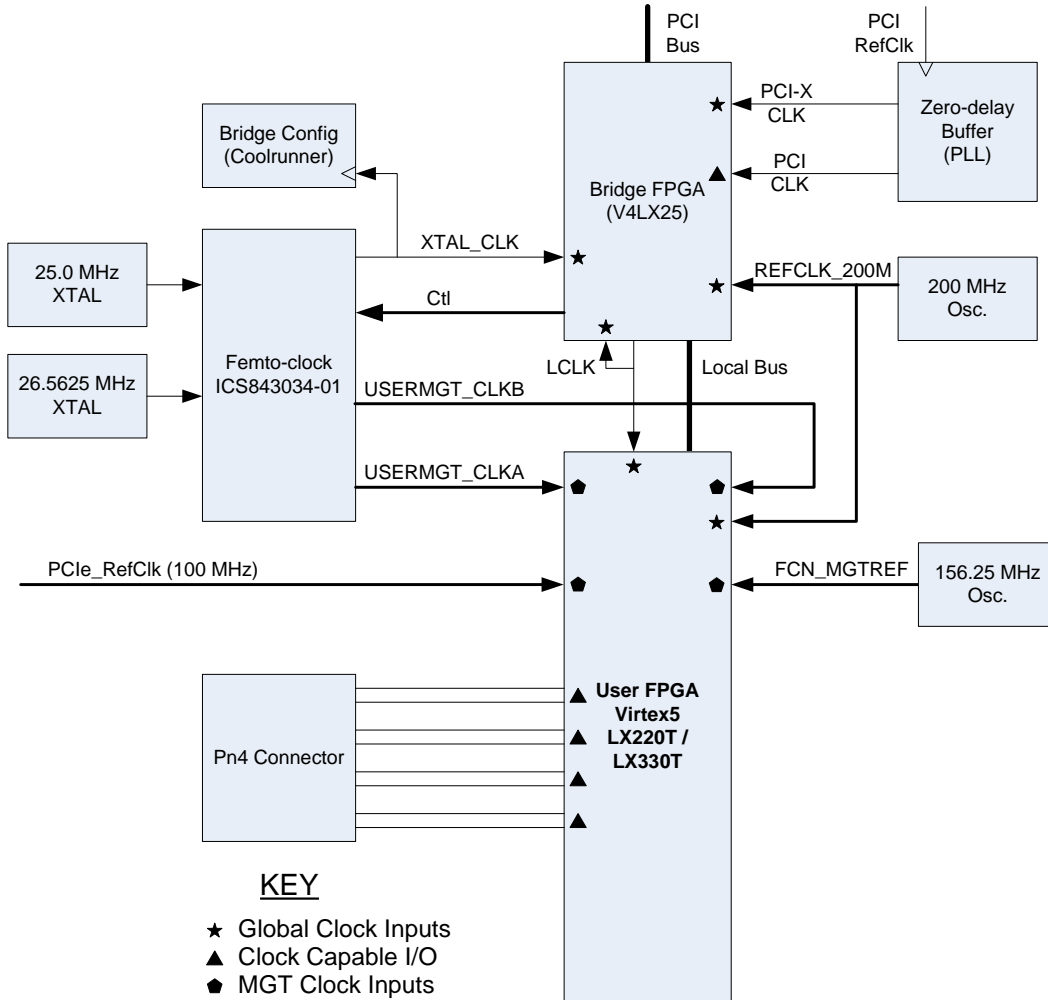

Figure 4 Clock Structure

4.5.1.   LCLK

The Local Bus can be used at up to 80 MHz and all timing is synchronised to LCLK between the Bridge and User FPGAs. LCLK is generated from a 200MHz reference by a DCM within the bridge FPGA. The minimum LCLK frequency (determined by the DCM specification) is 32MHz.

The LCLK frequency is set by writing to the board control logic. (See SDK for details and example application).

Note: If the user FPGA application includes a DCM driven by LCLK (or one of the other programmable clocks), the clock frequency should be set prior to FPGA configuration.

4.5.2. REFCLK

In order to make use of the IODELAY features of Virtex™-5, a stable low-jitter clock source is required to provide the base timing for tap delay lines in each IOB in the User FPGA. The ADM-XRC-5T2-ADV is fitted with a 200MHz LVPECL (LVDS optional) oscillator connected to global clock resource pins. This reference clock can also be used for application logic if required.

4.5.3. PCIe Reference Clock

A 100MHz PCIe reference clock input from the Primary XMC connector (Pn15) is connected to one of the dedicated MGT clock inputs on the user FPGA. (See Table 3 for details of the MGT clock connections.)

4.5.4. User MGT Clocks

A programmable, low-jitter clock source is provided by an ICS843034-01 "FemtoClocks" frequency synthesiser. The synthesiser has two source crystals – one at 26.5625MHz (for Fibre Channel applications) and another at 25.0MHz (suitable for PCIe, Gigabit Ethernet etc.). The synthesiser also has two clock outputs.

"USERMGT_CLKA" is connected to an MGT clock input on the top-half of the user FPGA. It may be used as an alternative to the PCIe reference for the MGTs connected to the Primary XMC.

"USERMGT_CLKB" is connected to an MGT clock input on the bottom half of the user FPGA. It may be used as the reference for the front user MGTs. (See Table 3 for details of the MGT clock connections.)

Note: Either of these clocks can provide a programmable source for applications that do not use MGTs.

4.5.5. FCN MGT Clock

A 156.25MHz precision oscillator is fitted on the ADM-XRC-5T2-ADV for Gigabit Serial I/O applications. There are also 3 other options for clock inputs to the MGT tiles of the FPGA. The oscillator frequency can be customised to suit applications requiring specific baud rates. Contact the factory for details.

Clock Name	GTP No.	FPGA Pin (P/N)	Reference for:
PCIE_REFCLK	114	AD4 / AD3	Primary XMC (Pn15) MGTs
USERMGT_CLKA	118	AK4 / AK3	Primary XMC (Pn15) MGTs
FCN_MGTREF	124	C4 / C3	Front (CN2) user MGTs
USERMGT_CLKB	112	V4 / V3	Front (CN2) user MGTs

Table 3 MGT Clock Connections

4.5.6. Rear (Pn4) Clocks

Four pairs of signals from Pn4 are connected to clock-capable inputs that can be used for regional clocking of the remaining Pn4 signals. See Table 9 for details.

4.5.7. PCI Clocks

The PCI Interface within the bridge FPGA requires a regional clock input for 66MHz PCI operation or a global clock input for PCI-X. To comply with the single-load requirement in the PCI specification, a zero-delay clock buffer is used to route the PCI clock to the two different clock inputs.

The clock buffer has a PLL with a minimum input frequency of 24MHz, potentially causing problems in applications that use the PCI 33MHz mode with a slow clock. In this case, the buffer can be bypassed to provide full PCI 33MHz compatibility.

4.6.   User FPGA

4.6.1.   Configuration

The ADM-XRC-5T2-ADV performs configuration from the host at high speed using SelectMAP. The FPGA may also be configured from flash or by JTAG via header J2.

Download from the host is the fastest way to configure the User FPGA with 8 bit SelectMAP mode enabled. This permits an ideal configuration speed of up to 40MB/s.

The ADM-XRC-5T2-ADV can be configured to boot the User FPGA from flash on power-up if a valid bit-stream is detected in the flash. Booting from flash will also configure the programmable clocks.

4.6.2. I/O Bank Voltages

Bank	Voltage	Description
0	3.3V	Configuration I/F
1, 4, 5, 6	1.5V	DDRII SRAM
2	3.3V	SelectMAP I/F, Serial Flash
3	3.3V	Clocks
19, 21, 23, 25	1.8V	DDRII DRAM
27, 29, 31, 33	1.8V	DDRII DRAM (LX330T only)
18	2.5V or 3.3V	Pn4 Interface
11, 13, 15, 17, 26	3.3V	ADV212 Interface
12, 20, 24	1.8V	Local Bus

Table 4 User FPGA I/O Bank Voltages

4.6.3. Memory Interfaces

The ADM-XRC-5T2-ADV has four independent banks of DDRII SDRAM when fitted with a LX330T, SX240T or FX200T target FPGA. (Two banks with all smaller FPGAs) Each bank consists of two memory devices in parallel to provide a 32 bit datapath. 1Gb Micron MT47H64M16 devices are fitted as standard to provide 256MB per bank. The board will support higher capacity devices when they become available.

The ADM-XRC-5T2-ADV has been designed for compatibility with Xilinx memory interface cores.

Details of the signalling standards are given in the table below:

Name	Direction	I/O Standard
DDR_ad[15:0], DDR_ba[2:0], DDR_rasn, DDR_casn, DDR_wen, DDR_csn, DDR_cke, DDR_odt	Output	SSTL18_I_DCI
DDR_ck0, DDR_ckn0	Output	DIFF_SSTL18_II
DDR_dq[15:0]	BiDir	SSTL18_II
DDR_dm[1:0]	Output	SSTL18_II_DCI
DDR_dqs[1:0], DDR_dqsn[1:0]	BiDir	DIFF_SSTL18_II
DDR_ck1, DDR_ckn1	Output	DIFF_SSTL18_II
DDR_dq[31:16]	BiDir	SSTL18_II
DDR_dm[3:2]	Output	SSTL18_II_DCI
DDR_dqs[3:2], DDR_dqsn[3:2]	BiDir	DIFF_SSTL18_II

Table 5 DDR Memory Bank Configuration

4.7. FCN Interface – MGT Links

Eight lanes of user MGT (GTP) links are routed to the front panel connectors. Lanes 0 – 3 are routed through J5, lanes 4 - 7 are routed through J4.

Signal	FPGA Pin	GTP Number	FCN J5 Pin
FCN_TX0_P	AA2	112B	S16

Table 6 FCN Interface - MGT Links

4.7.1. Copper Mating Cables

Suitable cables are available from Fujitsu "microGiGaCN Cable I/O" range of 8-pair cables in a variety of lengths and styles e.g. FCD-ZZ00001.

Molex provide an alternative source with their 'LaneLink' cables e.g. 74526 -1002

4.7.2. Optical Mating Cables

The optical interface uses external modules which plug in to the standard FCN style connector. These modules (e.g. EMCORE QTR3432) convert the electrical signals to optical format. Inter-module connection uses MJ3MM12RPR-10-0 (available from Fiberconnections Inc.) or similar

Please note that these items are not normally supplied by Alpha Data.

4.7.2.1. Important Notes on using Optical Modules

Optical modules provide a signal ('sense_l') indicating that they are present; however the presence of optical modules cannot be distinguished from a copper connection by relying on this signal alone.

Whilst the optical module supplies are disabled by default and protected by current limiting, the method shown in the example code should always be used to ensure that supplies do not drive into the short circuit presented when a copper cable is fitted.

<u>Caution</u>

This equipment uses Class 1 Laser devices; such devices are not considered to be hazardous when used for their intended purpose. Use of controls, adjustments or performance of procedures other than those specified herein may result in hazardous laser light exposure.

4.7.3. Example Gigabit I/O Applications

- Dual Infiniband 4x (4 lanes at 2.5Gb/s over copper or optical fibre)

- Dual 10Gb/s Ethernet CX4 (4 lanes at 3.125Gb/s over copper or optical fibre)

- Dual 10Gb/s FibreChannel (4 lanes at 3.1875Gb/s over copper or optical fibre)

- Dual 4 x OC-48 SONET

4.7.4. Front Panel multi-gigabit I/O Control & Status Signals

Signal	Pin Location	Description
BREFCK_ENAB	AC38	-high to enable the 156.25MHz oscillator on the board (pull-up on board)
STATUS_1	AC40	-Infiniband STATUS led (yellow) connector 1
ATTEN_1	AM42	-Infiniband ATTEN led (green) connector 1
STATUS_2	AC39	-Infiniband STATUS led (yellow) connector 2
ATTEN_2	AM41	-Infiniband ATTEN led (green) connector 2

Table 7 Board Control Signals

Signal	FCN Pin	Connector 1 (J5) FPGA Pin	Connector 2 (J4) FPGA Pin	Description
SENSE	G7	AR5	AM6	low indicates that an opto module has been fitted
FAULT	G6	AT6	AN5	low indicates that no data detected on the opto Rx channel
ODIS	G2	AT7	AN6	low to disable Tx on any module fitted on the channel
PSUEN	G8 (3V3 Pwr)	AP7	AP6	high to enable the opto power supply
OC_L	-	AP5	AL7	low indicates overcurrent on opto supply

Table 8 Optical Module Control Signals

4.8.   Pn4 I/O

Up to 16 pairs of differential or 32 single-ended signals are available on Pn4 and are sourced from Bank 18 of the User FPGA. All of the signal traces are routed as 100 Ohm differential pairs and each pair is matched in length. The worst case difference in trace length between any two pairs is 10mm. The pairs are distinguished by the signals names listed below and follow the pattern +/-: 1/3, 2/4, 5/7, 6/8…

Signal	FPGA Pin	Pn4 Pin	Pn4 Pin	FPGA Pin	Signal
PN4_P1	AF11	1	2	AE9	PN4_P2
PN4_N1	AF12	3	4	AE10	PN4_N2
PN4_P3	AF9	5	6	AD8	PN4_P4
PN4_N3	AF10	7	8	AE8	PN4_N4
PN4_P5	AF7	9	10 [CC]	AF5	PN4_P6
PN4_N5	AE7	11	12 [CC]	AF6	PN4_N6
PN4_P7	AC5 [CC]	13	14 [CC]	AB7	PN4_P8

PN4_N13	AB8	27	28	AK5	PN4_N14
PN4_P15	AB11	29	30	AJ7	PN4_P16
PN4_N15	AC10	31	32	AK7	PN4_N16

Table 9 Pn4 to FPGA Assignments

In Table 9, pins marked [CC] are clock capable and may be used to access the regional clocking resources in the FPGA.

Banks 18 is fitted with resistors to allow DCI terminations on Pn4 signals.

4.8.1.   Pn4 Signalling Voltage

The signalling voltage on the Pn4 connector (and User FPGA Bank 18) is selectable by switch SW2B.

Switch 2B	Pn4 voltage
Open	2.5V
Closed	3.3V

Table 10 Pn4 I/O Voltage Selection

It should be noted that the switch does not directly route power. The switch position is monitored by the board control logic which, in turn, sets a power multiplexer to be either 2.5V or 3.3V.

4.9.   XMC Interface

4.9.1.   Primary XMC Connector, P15

The MGT (GTP) links connected between the user FPGA and the Primary XMC connector, P15, are compatible with PCI Express and Serial RapidIO. Depending upon the carrier card, they may also be used for user-specific applications.

Table 11 XMC P15 Connections

4.10.   ADV212 Interface

The ADV212 is a single-chip JPEG 2000 codec from Analog Devices. It is targeted for video and high bandwidth image compression applications that can benefit from the enhanced quality and features provided by the JPEG 2000 (J2K)—ISO/IEC15444-1 image compression standard. The ADM-XRC-5T2-ADV features 4 ADV212 devices which can all operate independently or in 2 banks of 2 for full frame capabilities.

4.10.1. Signal Description

See the ADV212 data sheet and associated literature for a full description of the operation of these pins.

Signals common to each ADV212 bank

addr<1> to <3>	-ADV212 address bus
mclk	-ADV212 system clock
vclk	-ADV212 video data bus clock
hdat<0> to <31>	-ADV212 host data bus
field	-ADV212 field sync for video mode
hsync	-ADV212 horizontal sync for video mode
vsync	-ADV212 vertical sync for video mode
jpeg_reset_l	-asynchronous processor reset for ADV212's
scomm5	-synchronisation signal for multi-chip operation

Individual signals to each ADV212 codec

ack_l	- ADV212 acknowledge signal
cs_l	- ADV212 chip select signal
dack_l<0> to <1>	- ADV212 DMA acknowledge signals
dreq_l<0> to <1>	- ADV212 DMA request signals
irq_l	- ADV212 interrupt request signal
rd_l	- ADV212 read enable for host interface operation
we_l	- ADV212 write enable for host interface operation
vdat<0> to <11>	- ADV212 video data bus
scom4	- ADV212 LCODE Output in Encode Mode

4.10.2. JPEG Processor Interface Pin Locations

Bank Signals	Bank 1 (A & B)	Bank 2 (C & D)
